Dear Hiring Manager,

As a Computer Science senior at Oregon State University with a focus in Data Science, I am deeply passionate about leveraging technology to advance scientific research and public initiatives. With hands-on experience at NASA and Trimble, I specialize in building reliable software architectures and automating complex data pipelines to support critical, large-scale projects.

My dedication to research-driven development was solidified during my time with NASA, where I was tasked with migrating legacy atmospheric datasets to modernize their accessibility. By engineering real-time web mapping services, I helped ensure that vital environmental data was highly usable and impactful for end-users. I am highly comfortable writing Python scripts to automate complex data cleaning tasks, having previously processed over 500 distinct datasets to streamline organizational operations.

In research and government applications, software reliability is paramount. During my internship at Trimble, I demonstrated a rigorous commitment to quality by building an automated testing framework utilizing TypeScript and Playwright, I engineered over 200 API and UI tests. This led to successfully merging 17 pull requests into the production codebase and reinforcing the CI/CD pipeline.

I am eager to bring my data literacy, commitment to rigorous software testing, and passion for mission-driven engineering to your organization. I will graduate in June 2026 and am available for an interview immediately. Thank you for your time and consideration.

Sincerely,

Isabella Mann
